

1. Objective

The SEO/AEO recommendations for `metawurks.com/product` were implemented, together with the site-wide metadata, sitemap and robots infrastructure the page depends on. No ranking or traffic effect has been measured and none is claimed.

2. Before vs After

AREA	BEFORE	AFTER
H1	<code>Our Products</code>	AI Document Intelligence for Bookkeepers, Law Firms & Real Estate Teams — one H1
Content	~240 words, 3 H2s	2,156 words, 11 H2s / 19 H3s
Metadata	No metadata export; one title shared by 10 routes	Unique title + description on all 9 public routes
Canonical	Missing	<code>https://metawurks.com/product</code> ; present on all 9 routes
Structured data	None	JSON-LD <code>@graph</code> : Organization, WebSite, WebPage, BreadcrumbList, SoftwareApplication, FAQPage
FAQ / AEO	None	8 visible Q&As + <code>FAQPage</code> schema; 8/8 verbatim parity with the visible page
CTAs	None in body	Hero: Start Free + Book a Live Demo. Closing: Start Free + Compare plans. Trust line
ICP targeting	Generic “business”	4 cards: bookkeepers, law firms, real estate, SMB/ops
Internal links	0 body links	12 contextual links, descriptive anchors, all HTTP 200
Sitemap / robots	<code>/sitemap.xml</code> returned 404; static robots, no AI agents	<code>app/sitemap.ts</code> 46 URLs; <code>app/robots.ts</code> declares sitemap + 9 AI agents
Social metadata	None	Open Graph (incl. image 1536×1024 + alt) and Twitter <code>summary_large_image</code>

3. Implemented changes

1. Reworked `/product` H1, hero and messaging for the four target ICPs.
2. Added AEO sections: definition, ChatGPT comparison, ICP cards, how-it-works, file types, AI models, security, pricing.
3. Added an 8-question FAQ, rendered visibly and mirrored into `FAQPage` JSON-LD from one shared source.
4. Added unique title, description, canonical, Open Graph and Twitter metadata to all 9 public routes.
5. Added JSON-LD `@graph` with 6 schema types; no ratings, reviews or unverified pricing.
6. Added `app/sitemap.ts` (46 URLs) and `app/robots.ts` naming 9 AI crawlers; removed the conflicting static `robots.txt`.
7. Added 12 contextual internal links and in-body CTAs.
8. Added `next/image` usage with explicit dimensions, descriptive alt text and correct loading behaviour.
9. Removed the unsupported statistics bar, the duplicated H2 and the duplicated closing copy.

4. Files changed

FILE	PURPOSE
<code>app/product/page.tsx</code>	<code>/product</code> rewrite — content, metadata, JSON-LD
<code>lib/productContent.ts</code>	Single source for model list, file types, FAQ and price; feeds both the page and the schema
<code>lib/seo.ts</code>	Site constants, Organization and WebSite schema
<code>components/JsonLd.tsx</code>	JSON-LD renderer
<code>components/ProductScreenshot.tsx</code>	Documented screenshot placeholder — no product screenshot was fabricated
<code>app/sitemap.ts</code>	46-URL sitemap

FILE	PURPOSE
<code>app/robots.ts</code>	Robots route; replaces the deleted <code>public/robots.txt</code>
<code>app/page.tsx</code>	Homepage metadata + Organization/WebSite JSON-LD
<code>app/<route>/layout.tsx</code> x7	Per-route metadata for pages that cannot export it directly

5. Validation

CHECK	RESULT	DETAIL
<code>/product</code>	PASS	HTTP 200 on the production build
Build	PASS	<code>npm run build</code> — 54/54 static pages generated
Lint	BLOCKED — pre-existing	<code>npm run lint</code> cannot start: <code>eslint.config.js</code> imports three packages absent from the manifest. Fails identically at baseline. SEO/AEO code contributes 0 errors (3 at baseline vs 3 now)
Typecheck	PASS (application code)	0 errors in application code. 6 pre-existing errors in generated <code>.next/types</code> , from two API route files that are entirely commented out; identical at baseline
JSON-LD	PASS	Parses; 6 schema types; no fabricated ratings, reviews or pricing
FAQ / AEO parity	PASS	All 8 questions and 8 answers present verbatim in the visible HTML
Sitemap	PASS	46 URLs, valid XML, every URL verified reachable
Internal links	PASS	All 12 <code>/product</code> body links return 200

6. Factual items requiring confirmation

Product-owner confirmation is required before this content is published.

Each item is an unresolved contradiction inside the repository. Unverifiable claims were omitted from the page rather than softened, so nothing below is currently published on `/product`. Full evidence is in `FACTUAL_CONFLICTS.md`.

TOPIC	WHERE IT APPEARS	UNRESOLVED ISSUE
AI model list	<code>app/pricing/page.tsx:179, :191</code> <code>components/HeroSection.tsx:160</code>	Pricing copy adds Mistral, LLaMA and “30+ other AI models”; homepage graphics add Cohere. <code>app/docs/page.tsx:399–404</code> documents six providers with versions and names none of these.
Pricing	<code>app/pricing/page.tsx:113, :254</code> <code>:49, :81, :114</code>	Enterprise \$99/\$97; “Save 30%” badge against actual savings of 2.0–10.5%; <code>originalPrice</code> is below <code>price</code> on every plan and is never rendered.
Free tier & token limits	<code>app/pricing/page.tsx:19</code> vs <code>:203</code>	Plan card says free for 1 month; FAQ says 1,000 messages per month, implying an ongoing plan. Table records messages as “Limited”.
Security claims	<code>components/OrchestrationSection.tsx:23</code> <code>app/pricing/page.tsx:199</code>	SSO, role-based access and audit logs are claimed — the first is rendered live on the homepage. Neither <code>/docs</code> nor the privacy policy supports them.
Certifications & SLA	<code>components/TrustSection.tsx:12–15</code>	SOC 2 Type II, end-to-end encryption, data residency and 99.99% uptime asserted. The component is not imported by any page, so it is not rendered today — but would go live the moment it is used.
Supported file types / OCR	<code>app/docs/page.tsx:97</code>	Image formats are accepted for upload, but nothing states text is extracted from scans. “OCR” appears nowhere in the repository.
Dropbox integration	<code>components/OrchestrationSection.tsx:21</code>	Dropbox integration claimed on the homepage; <code>app/docs/page.tsx:650–651</code> documents only Google Drive and OneDrive.
Vertical pages & screenshot	—	The four <code>/for/*</code> routes referenced by the spec do not exist and were not linked. No product screenshot exists; a documented placeholder ships instead.

7. Current status

Implementation complete; not publication-ready. The `/product` rewrite, metadata, structured data, sitemap and robots work is built and verified, and the SEO/AEO code introduces zero lint errors. Two items remain open and sit outside this work: (1) the factual items in §6, which require product-owner confirmation before the content is published; and (2) a pre-existing ESLint configuration defect that prevents `npm run lint` from running at all, logged as a separate repository maintenance item. The Markdown report is the complete record.
